

- Customised: pre-assembled cable from LINK -

LINK is best known for its security components such as magnetic contacts, opening and glass breakage detectors or door loops. But not many people know: LINK also manufactures a wide variety of cables. And not just for the security sector.

A wealth of experience

LINK has been manufacturing its own cables for its security components for many years. It does this in its very own modern machine park. Cutting and stripping cables, stripping and crimping braids, applying connectors or sockets to cables and then mechanically bundling them, with custom printing on the sheath – the ability to implement a large number of cable assemblies extremely flexibly in-house helps to ensure that we are able to cater perfectly to individual customer requests. LINK is taking advantage of this know-how and expanding its product portfolio. Pre-assembled cables from LINK are now also available separately from the security components. This offer is aimed not only at customers in the security sector, but also generally at customers from a wide range of industries.

Wide range

LINK can handle a very wide range of cables in its cable centre in two and even three-shift operation: cables with PVC insulation and sheath (LYY), flexible and robust drag chain cables (L19C11Y) or even oil and chemical-resistant oil flex cables. The cables can be cut to any length, starting from a length of 0.2 metres. From 1.6 metres, they are mechanically coiled and tied so that further processing can proceed smoothly. The cable diameters (from 2.5 to 8 millimetres), the number of leads contained therein (up to 14 in one cable) and the braid cross sections (from 0.14 mm² to 0.75 mm²) are also variable. The LINK standard range of services also includes fitting of various JST connector types with a wire diameter of AWG 18 to AWG 28.

Custom manufacturing possible

LINK customers have the choice between standard products and made-to-measure solutions. First, the feasibility of custom design requests is reviewed. The customer then receives the result in a period of about one to two weeks. LINK meets customer-specific requirements not only for security components, but also for pre-assembled cables.
